POINT SOURCE INVENTORY

1.0 INTRODUCTION AND SCOPE

The point source inventory consists of emissions from individual facilities. Primarily, these are industrial or commercial facilities that must have permits issued by the North Carolina Division of Air Quality (NC DAQ) or by the Forsyth County Environmental Affairs Department for Forsyth County to emit air pollutants.

Although both the State and County agencies inventory all the criteria pollutants and a large number of toxic pollutants, only the nitrogen oxides (NOx) and volatile organic compounds (VOC) are reported here since they are important for ozone formation. The emissions in this report were projected to the years 2000, 2004, 2007, 2010, 2012, and 2015.

2.0 OVERALL METHODOLOGY

All permitted sources are required to report emissions annually in the case of larger sources and, until recently, every three years in the case of smaller sources. The point source emissions used to develop this report, except for cases where noted, are for the year 1999 since that was the latest year available in which small sources were required to report. The emissions data upon which this report is based was pulled from files maintained by the NC DAQ and by the Forsyth County Environmental Affairs Dept. The same data was used to produce the files submitted to the US EPA for the 1999 National Emissions Inventory (NEI). States are required to produce emission inventories and submit them to the NEI every three years. 1999 was the latest year prior to 2000 where the data in the NEI was quality assured.

2.1 SOURCE IDENTIFICATION

All facilities required to have permits to operate sources of air pollution are known and are required to submit emission inventories.

Publicly owned treatment works (POTW's) emit some VOC's that is in the incoming wastewater and escapes as the water is treated. Mr. Lou Polletta of the NC Division of Water Quality was contacted for the data necessary to identify these sources and calculate emission estimates.

Landfills emit VOC's that escape through the soil covering the waste material. The primary gaseous emission is methane, which is not a VOC. Information on the location, age, closure date, and refuse storage amounts was obtained from the NC Division of Waste Management so that these emissions could be calculated.

2.2 EMISSION ESTIMATION APPROACH

The emission inventory information reported to the State and to Forsyth County was transferred to the i-STEPS program by both State and County employees. This program helps make sure that certain required data elements are not omitted. It also performs some calculations, thereby minimizing the occurrence of errors. Depending on the particular process and facility, emissions may be calculated by various means. In many cases, emissions are estimated using emission factors published in EPA's AP-42, Compilation of Air Pollutant Emission Factors. In a relatively few cases, locally produced emission factors may be used. Sometimes, a mass balance calculation can be employed. In some cases, there is direct continuous monitoring of emissions that are reported. For any particular case, it is possible to determine how emissions were

calculated by going to the NEI. This material may be downloaded from the following EPA web location: <http://www.epa.gov/ttn/chief/net/1999inventory.html>.

For this Maintenance Area Inventory, EPA guidance requires that emissions from sources with control devices be adjusted upwards by applying 80% rule effectiveness (RE) if emissions are not directly determined. There were a number of these situations. The practical effect of this requirement is that emissions officially reported in the NEI are adjusted upwards by 5, 10, or 20 times or more. Sources with very efficient control devices show the greatest inflation since the calculation assumes that the control device operates at stated efficiency 80% of the time and with no control 20% of the time. Sources with control devices were evaluated and, where appropriate, had their emissions adjusted for 80% RE. Anyone wishing to know more should contact the NC DAQ, Attainment Planning Branch.

Emissions reported in the NEI and maintained by NC DAQ and Forsyth County are annual emissions. There is also data for operating hours per day and per year, days per week, and the percent of emissions occurring in the summer quarter. Using this information, average ozone season daily emissions were calculated. In some cases, some of the temporal data was missing. For these cases, plausible numbers were applied based on other sources at the facility or similar facilities.

Emissions from POTW's were estimated using data obtained from the NC Division of Water Quality and an emission factor of 8.9 pounds of VOC per million gallons of wastewater. This factor is from EPA-454/R-95-012, FIRE Version 5.0.

VOC's from landfills were calculated using data supplied by the NC Division of Waste Management and EPA's Landfill Gas Emission Model, Version 2.0. Certain landfills are required to meet New Source Performance Standards or Emission Guidelines. These facilities are required to install pipes to collect landfill gas for disposal by combustion. Ideally, the gas is burned in a useful way, such as, in a boiler or in an engine for electric generation. For the landfills equipped with gas collection pipes, it was assumed that 25% of the gas (and 25% of the VOC's) escaped capture as described in AP-42, Compilation of Air Pollutant Emission Factors, Section 2.4.4.2.

2.3 EMISSION PROJECTION

The 1999 emissions inventory was used as the baseline for the projected emissions in this report. The 1999 emissions inventory was projected to future years by utilizing EPA's Economic

Growth Analysis System (E-GAS) version 4 software. It should be noted that the latest data used by E-GAS v4.0 is from the year 1996. The factors used from E-GAS were based on the Bureau of Labor and Statistics (BLS) and are associated with emissions at the 2-digit SIC level. E-GAS was designed to produce four factor groups for four county areas. Davie, Davidson, Forsyth, and Guilford Counties are in group S9, Durham and Wake are in S7 group, Charlotte and surrounding counties are in group S8 and the remaining State is in group S6. A portion of Granville County is part of the S7 group because it borders three S7 counties and is expected to exhibit growth like the surrounding maintenance areas while the remaining portion of the County is part of the S6 group.

A large amount of the VOC's in the Greensboro/Winston-Salem/High Point area was from furniture manufacturing (SIC group 25). The E-GAS projection factors produced a considerable increase in emissions from furniture manufacturing even though furniture manufacturing has declined considerably in the last few years. The following is an e-mail response from Mr. Bill Perdue of the American Furniture Manufacturers Association to a question regarding the accuracy of E-GAS projection factors for furniture manufacturing:

*Subject: RE: Growth Rates
Date: Thu, 14 Nov 2002 20:57:25 -0500
From: "Bill Perdue" <bperdue@afma4u.org>
To: "Bob Wooten" <Bob.Wooten@ncmail.net>*

Bob ... after discussions with several of our members and letting them look @ the attached listing of facilities, it is apparent to us in the furniture industry that the projected growth rates are too high. Enclosed is a brief description of the industry's position and reason why the growth rate should be adjusted to reflect the downward trends in the industry. I hope this helps you in your work in trying to establish the projected growth rates. Please call me if you have further questions.

- 1. With the growing pressure on domestic furniture manufacturing from Asia, more and more of the current domestic production will be shifted off-shore creating a sharp reduction in actual emissions reflected in the emissions inventory. This trend has lead to the continued reduction of excess domestic manufacturing capacity reflected in numerous plant closings in the State.*
- 2. Thomasville Furniture Industries (see attachment) has closed 4 facilities on the list used to compile the emissions inventory. To further underscore the industries downsizing, La-Z-Boy has closed a total of 11 manufacturing facilities during FY02 ... 4 of those facilities in the State.*
- 3. While there are several furniture manufacturers experiencing positive growth, the growth can be attributed to the introduction of imported goods into*

the product line. Most, if not all, of this positive growth resulted from decisions to shift certain price sensitive items in the product line off-shore to Asia. It should be noted that the shift and dependence by many furniture manufacturers on off-shore production has forced a drastic reduction in production capacity in their domestic plants. Some member companies have reported to importing up to 65% of their product line. Most of the manufacturers listed will be importing some part of their product line ... production that 3 years ago would have been manufactured domestically.

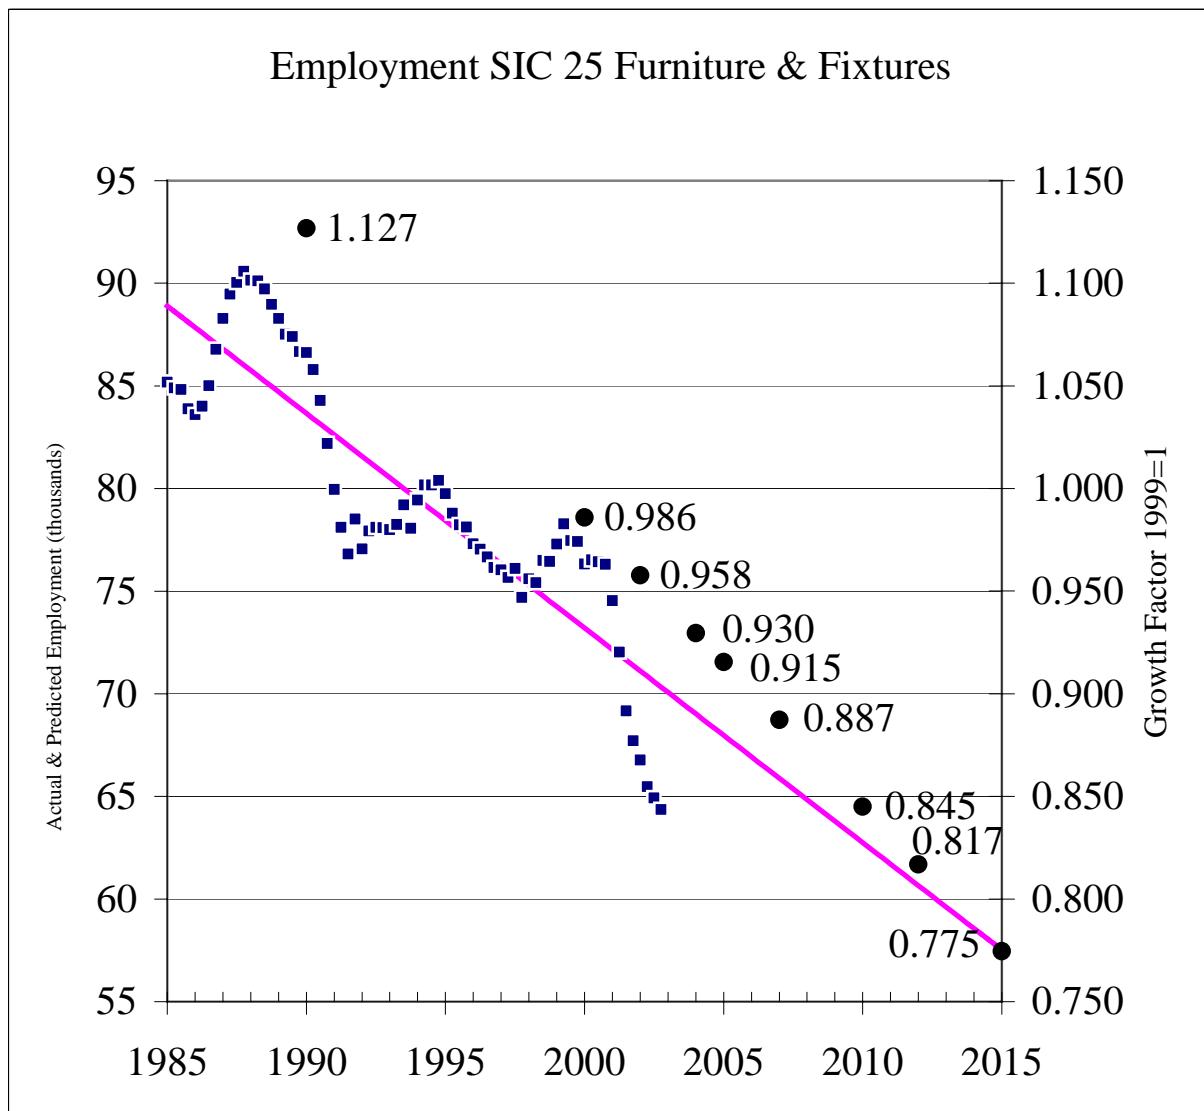

4. Based on the continued trend to supplement or import entire product lines, there will be continued pressure on domestic manufacturing with further reductions in production capacity leading to stagnant or negative growth in domestic manufacturing capacity.

5. Due to the reduced domestic production capacity, several member companies indicated that they have reduced their hours of operation. Several reported working 4 day weeks with a maximum of 32 hours of production in a typical schedule. Again it should be noted, that this reduction in manufacturing hours will result in a reduction in emissions. This will further put downward pressure on the proposed growth rates.

6. As companies begin to evaluate their product mix ... domestic vs. import ... they will begin to make strategic decisions to further consolidate domestic manufacturing operations. This will result in additional plant closings as the industry moves forward. Again, this will further reduce actual emissions as must be reflected in the projected growth rates. One member company indicated they are already in the process of looking at their facilities to determine which have the best manufacturing efficiencies in order to shift production to more profitable locations. Again, this will force companies to close the most inefficient plants ... further putting downward pressure on the projected growth rates.

Therefore, to obtain more accurate projection factors, Glenn Sappie, an economist with the Planning Section of NCDAQ, researched employment data for SIC 25 and produced the projection factors shown in the following graph. These factors were used for projecting employment data for furniture manufacturing (SIC 25) in both maintenance areas.

Graph 2.3-1 Employment Data

Employment -\MFG Furniture and Fixtures\Thousands, SA \Bureau of Labor Statistics,
DRI-WEFA \North Carolina

Source: US_Regional Data, Data_Tables, Core_Long_Term_Data_XLS_Quarterly_North Carolina, Global Insight, Fall 2002 (Based on Standard Macro of September 2002)

Graph 2.3-1 represents quarterly (seasonally adjusted) furniture manufacturing SIC 25 employment in the State of North Carolina. A predicted employment linear trend is estimated and an emission growth factor is calculated, where the predicted employment in 1999 is indexed to equal one. This declining growth slope represents a 1.4% annual reduction.

Emissions from landfills were not projected using emission factors. The Landfill Gas Emission Model calculates future year emissions. It is believed that it is unlikely that new large landfills

will be started in the maintenance counties because of the political problems associated with landfills in metropolitan counties. The trend is to haul garbage to large landfills established in rural areas.

2.4 FUTURE EMISSION REDUCTIONS

Emissions of NOx will be reduced in the Greensboro/Winston-Salem/High Point area due to the NOx SIP Call. Affected sources are the Transcontinental Gas Pipeline compressor station in Davidson County and the R J Reynolds Tobaccoville facility in Forsyth County. The emissions from these facilities were set at their regulatory limits for the future years. In addition, both the Greensboro/Winston-Salem/High Point and the Raleigh/Durham areas benefit from NOx reductions required at large electrical generation facilities nearby but not in the maintenance area counties.

MACT regulations are intended to reduce hazardous air pollutants (HAPS), some of which are VOC's. In some cases, reduction of HAPS that are VOC's is accomplished by switching to VOC's that are not HAPS so there is no VOC reduction. In other cases, compliance with a MACT regulation can be expected to reduce VOC's. A number of MACT regulations were implemented by 1999 so that any effect they have on VOC's is incorporated in the 2000 and later point source inventory.

There is a facility in Wake County that produces vegetable oil by solvent extraction. The applicable MACT standard is Subpart GGGG. According to the EPA furnished fact sheet for this regulation, VOC;s should be reduced by 25% following the April 12, 2004 compliance date. These reductions were incorporated in the projected emissions.

It is likely there will be some additional VOC reductions due to new MACT rules in the maintenance area counties but it was not possible to determine which sources and how much reduction in the time available. One of the difficulties is that the MACT documents don't or can't always make a clear statement of how much VOC reductions will result from the HAPS reductions. Sometimes it isn't possible to say until a particular affected source considers possible control options.

3.0 QUALITY ASSURANCE

The 1999 emission inventory has undergone a number of quality assurance checks so that it meets the standards for the National Emissions Inventory. The i-STEPS program helps insure that important data elements are present. Where the program performs calculations, it helps avoid math errors. In addition, since the State began collecting annual fees for emissions from Title V sources, both the State and the sources are careful that the tons-per-year emissions reported are accurate.

Calculations of emissions from POTW's and landfills were carefully checked for accuracy. Segment level emissions were totaled to be sure that they equaled the totals for plant level emissions.

4.0 TOTAL POINT SOURCES EMISSIONS

4.1 GREENSBORO/WINSTON-SALEM/HIGH POINT MAINTENANCE AREA

There were no point sources in the portion of Davie County where it is included in the maintenance area.

5.0 DISCUSSION OF POINT SOURCE CATEGORIES

Industrial processes in the inventory are identified with 8-digit numbers known as the Source Classification Codes (SCC). These are grouped numerically into a number of categories for convenience. Following is the 2000 inventory reported by SCC. It should be remembered that the SCC in any particular instance was selected by an individual entering inventory data into a computer maintained record. It may be that in some cases, other individuals would have selected other codes. In some cases, there are two or three parallel codes that describe the same sort of equipment, the difference being size. In other cases, one is able to select a general code for an overall process or use several more specific codes that together would be covered by the more general one. If, upon consideration, it appears that a more appropriate code could have been selected, that does not mean that the reported emissions are inaccurate.

A listing of SCC with descriptions may be found in FIRE Version 5.0 Source Classification Codes And Emission Factor Listing For Criteria Air Pollutants, EPA-454/R-95-012.

Occasionally, new SCC are defined so it may be useful to search the EPA's website for new entries.

5.1 EXTERNAL COMBUSTION BOILERS

The codes 1-01-xxx-xx are for boilers for electrical generation. Codes 1-02-xxx-xx are for industrial boilers. Codes 1-03-xxx-xx are for commercial and institutional boilers. These are primarily of interest due to NOx emissions. CO emissions are generally an order of magnitude or more lower than NOx and VOC runs two orders of magnitude or more lower.

5.2 INTERNAL COMBUSTION ENGINES

Internal combustion engines for electrical generation have SCC in the 2-01-xxx-xx group. Industrial engines are classified in the 2-02-xxx-xx group while engines for commercial and institutional use are in the 2-03-xxx-xx group. Engines may be either turbines or reciprocating and fuels are either a gas or a petroleum liquid.

5.3 INDUSTRIAL PROCESSES

There are a large number of SCC under the heading of industrial processes. Many of these are of most significance for VOC but some do emit NOx. Codes 3-01-xxx-xx are chemical manufacturing. Codes 3-02-xxx-xx are for processes particular to food and agriculture. Primary metal production is under the 3-03-xxx-xx group while secondary metal production processes are in the 3-04-xxx-xx group. Mineral products processes are in SCC 3-05-xxx-xx and pulp and paper and wood products are in 3-07-xxx-xx. Rubber and miscellaneous plastics products are in the 3-08-xxx-xx series, fabricated metal products are 3-09-xxx-xx, and oil and gas production are 3-10-xxx-xx. 3-12-xxx-xx is miscellaneous machinery. Electrical equipment is found under 3-13-xxx-xx and transportation equipment under 3-14-xxx-xx. 3-15-020-xx is health care-hospitals while 3-15-021-xx is health care-crematoriums. SCC 3-20-xxx-xx is for leather and leather products. Processes for textile products are found under 3-30-xxx-xx. In-process fuel use can result in significant NOx emissions and is in category 3-90-xxx-xx.

5.4 PETROLEUM AND SOLVENT EVAPORATION

This group of sources emits volatile organic compounds (VOC). SCC in the 4-01-xxx-xx group are for organic solvent evaporation. Surface coating operations are grouped under SCC 4-02-xxx-xx. Petroleum product storage at refineries falls under SCC 4-03-xxx-xx while processes at bulk terminals and bulk plants are assigned SCC in the 4-04-xxx-xx group. Printing and publishing are in the 4-05-xxx-xx group of SCC. SCC group 4-07-xxx-xx covers organic chemical storage. Additional processes causing organic solvent evaporation are in SCC group 4-90-xxx-xx.
